

RiskTool System

One of the greatest challenges facing businesses today is the increasingly complex task of managing corporate risk. The RiskTool System is a comprehensive loss prevention and risk management solution that allows users to identify, analyze and manage their operational exposures. Designed exclusively for Chartis, this complete, web-based system provides a proactive and flexible approach to managing risk across an enterprise.

Features and Benefits

The RiskTool System brings the management of risk to a new level of functionality and ease of use. The System is highly customizable, so you can easily upload and incorporate existing risk management programs and data, as well as organizational structure and employee information. Through the RiskTool System, you can:

Predict and prevent loss exposures. RiskTool collects enterprise risk information to build and maintain a risk baseline, allowing a company to compare itself with similar companies, identify areas of risk and implement controls to prevent losses before they happen. Advanced analytics and reporting features evaluate risk in real-time and generate specific recommendations to minimize loss exposure.

Manage a safety program. RiskTool organizes and monitors risk management activities, such as audits, best practice assessments, incident reporting and company inventories. User-defined performance and compliance indicators can be tracked to measure operating performance against corporate goals and objectives.

Simplify administrative processes. By standardizing loss control practices across the organization into one simple system, RiskTool automates costly and time-sensitive internal processes. RiskTool provides a single resource for all stakeholders to access the risk intelligence they need, reducing information bottlenecks and ensuring procedural consistency and compliance.

Access extensive training resources and global risk information. RiskTool's comprehensive library contains hundreds of industry-specific policies, training programs and safety briefs to help companies conduct, test and record employee training. A collection of over 10,000 hyperlinks also connects users to critical risk topics and compliance-related information from government agencies, regulatory standards and established best practices.
